Marshal: TBD

Tracked by: No release assigned yet

Feature Status: Open planning

Outline

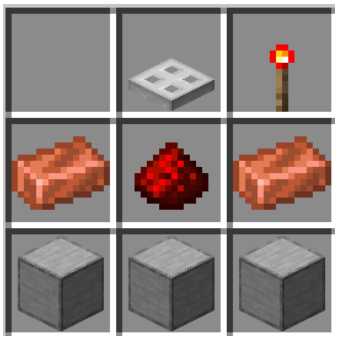

Stadium Blocks are configurable blocks intended for stadium-style battles, where players and server owners, where permitted, can define an arena region, trainer and Pokémon placement requirements, and scripted camera behavior.
The Stadium Block workflow includes defining an arena footprint and constraints (size, usable area, and required player positions), selecting a battle mode/format, and configuring camera paths for key battle phases (start, idle, attacks, send-outs, and victory).

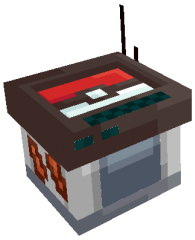

Feature Components

Type	Description	Status	Notes
Model	Stadium Block model	Available	
Sound	Drone Rotom release sound effect	Available	

Crafting Recipe

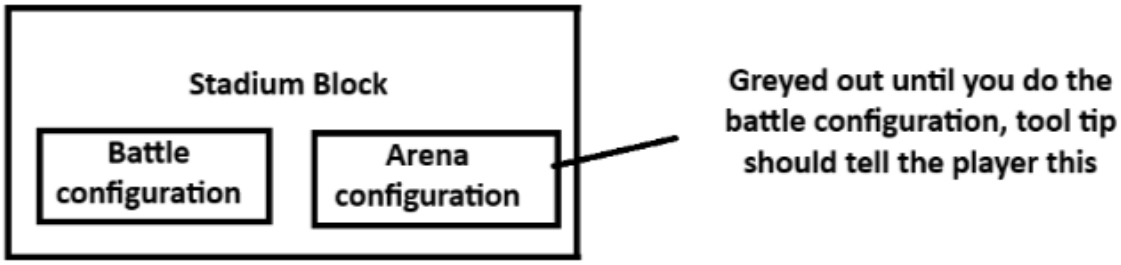

The stadium block will utilize an iron trap door in the center, redstone torch top right, a copper ingot, redstone dust, and a copper ingot in the middle, and 3 smooth stone blocks on the bottom.

User Interface

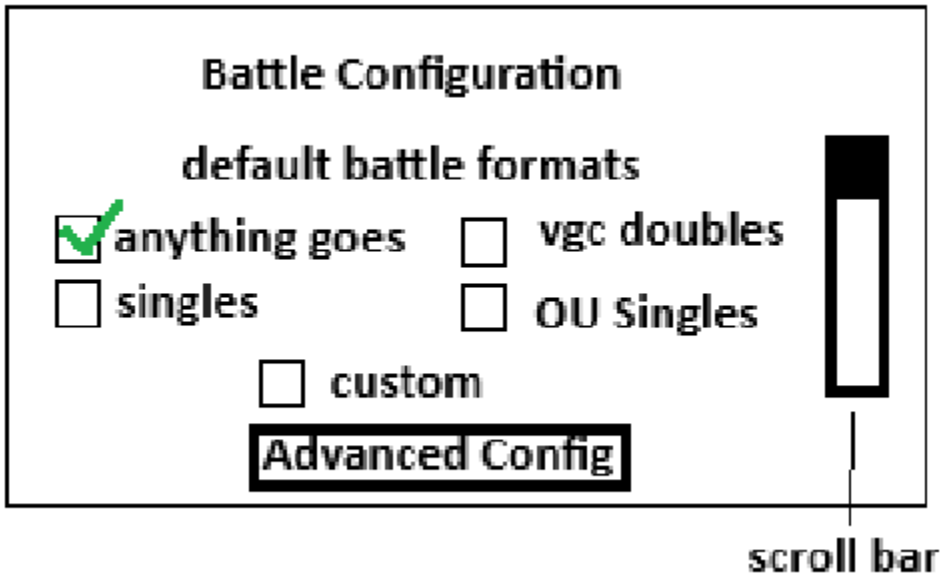

The Home Screen

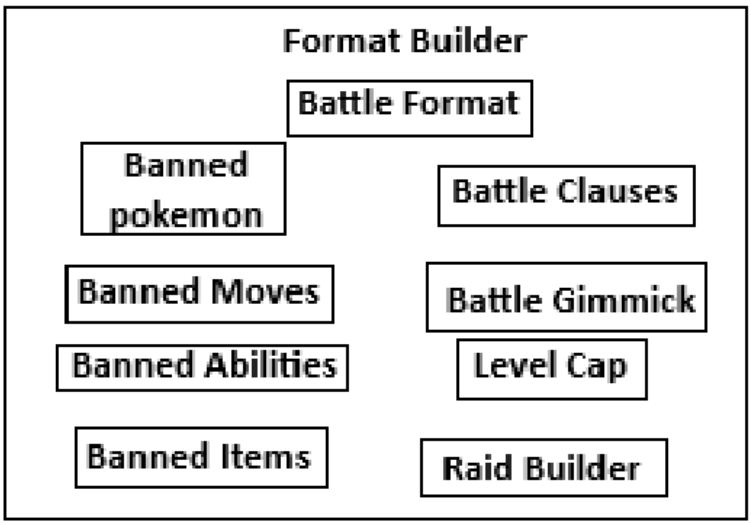

- When right-clicking the stadium block, you are presented with the home screen. It has two options; “battle configuration” and “arena configuration”. The player must set up the battle configuration before they can set up the arena configuration. A tool tip saying, “You must set up the battle configuration before you set up the arena configuration!” will appear while the button is greyed out if hovered over with the cursor.
- Battle Configuration is for determining the type of battle the stadium block will initiate

- Arena Configuration is for determining the size of the arena and where Pokemon and players are placed.

Battle Configuration

- The battle configuration button will bring you to a list of datapackable battle formats with a scroll bar to see everything currently loaded on the world/server.
- NEED TO PUT WHERE BATTLE FORMATS ARE READ FROM IN FILES AND EXAMPLE JSON
- When you select “custom” the advanced config button will be ungreyed out and bring you to a more detailed in-game GUI that will allow you to select multiple formats without the need for making a datapack. This is important for players on a server as they won’t have access to datapacks. The options selected in the advanced config will be saved automatically to the specific stadium block being edited and will only be used when “custom” is selected.

- Advanced battle configuration has 7 player available options, and 1 op level option
    - Battle Format
        - This will say singles, doubles, triples, tag team/multi-battle, raids, and then back to singles where you cycle through formats
        - Only one can be selected
    - Battle Clauses
        - Brings you to a scrollable list that gives you predefined battle clauses
        - Datapack to add more clauses, might not be possible
        - Multiple can be selected
    - Battle Gimmick
        - Gives you the option to select what gimmicks are allowed in your battle
            - Megas
            - Z-Moves
            - Dynamax
            - Terastilization
        - Multiple can be selected
    - Level Cap
        - Forces pokemon to be a specific level
    - Banned Pokemon

        - Pre-defined list that are datapackable
        - Search bar for selecting individual pokemon
    - Banned Moves
        - Search bar for selecting individual moves
    - Banned Abilities
        - Search bar for selecting individual Abilities
    - Banned Items
        - Search bar for selecting individual items
    - Team Preview/Order Selection
        - Check box to enable team preview or not before a battle begins
        - Read more about it here
    - Pokemon Limit
        - Limits the amount of pokemon you're allowed to bring to a fight 1-6
            - Doubles require even number of pokemon
            - If team preview is enabled, have the
    - Battle Timer
        - Turn timer for selecting how many seconds a turn should last
        - How long a battle should last as a whole, whoever has the most pokemon left/ most HP is the winner
    - Raid Builder
        - Op level option
        - Future feature as cobblemon does not currently have raids
    - Reset button
        - Clears the custom fields
- This allows you to name your custom format and it shows up in your Battle Configuration scroll bar
    - These saved formats are limited to 3 per block for non OP players (modify the cobblemon config to increase/decrease)
    - When you select your custom format and click advanced config you can modify your existing format
    - These formats are lock to the block, if you destroy the block, it saves it to the block so you can transport your custom configuration
        - Same concept as a beehive already having a bee in it

- Hiroku may get mad
    - Nah I'm chill

Arena Configuration

- Once a battle configuration has been chosen, the player will be able to click on "Arena Configuration" in the stadium block home screen. When clicked, the player will be presented with a UI similar to the one above (The 3rd person perspective in the concept art is just for context. The UI will likely be similar to other UIs where the background darkens and the UI is imposed on top of that). The arena configuration will be automatically set to "edit" mode. The player can not click "confirm" to exit edit mode until all positions are placed. There is a title showing what battle type it is (top right in concept art), and a series of smaller buttons indicating different positions the player must set for the arena to be configured (top left in concept art)
- The stadium block can check in all cardinal directions in a radius of 32 blocks. Anything outside of that radius will not get checked. The stadium block boundaries also go to the top and bottom of the world height (This can change if needed.)
- Clicking any of the buttons on the top left will give you a "beacon" item with a unique uuid tied to this stadium block
    - You will be able to get as many of these as needed if one is not present in the world
    - If one is present in the world it will delete the old one and give you a new one so you can't have infinite

        - Alternatively, it renders the old one useless, but does not delete it. Allowing it to be used for decor 😀. Either option works.
    - If a beacon is already placed and you click the button again it will NOT delete the data where it is placed in the world unless you physically place it down again
- C1 and C2 are corner beacons
    - They have 3 phases
        - Red
        - Yellow
        - Green
    - Red phase means it's too far away from the stadium block and will not be used
    - Yellow means it's in bounds of a stadium block but corner 1 or 2 is missing
    - Green means both corners are placed down correctly
    - Corners are flat planes, they can be placed in a 3d space, but y value is ignored as it's not important for the overall selection of an arena
- P1 and P2 (T1P1 and T1P2, T2P1 and T2P2 for tag team) are player beacons
    - Like corners, these have 3 phases
        - Red
        - Yellow
        - Green
    - Red phase is too far away from the stadium block
    - Yellow means the other player needs to be placed
    - Green means all players have been placed correctly
    - These items have no directionality, it's important the stadium block makes players face their opponent pokemon
        - For tag teams T1P1 and T1P2 are paired, these will need to look at the opponent's pokemon closest to them
            - If a players are placed diagonally for example it will be smart enough to know T1P1 needs to look at T2P2 instead of it being a cross
            - No system in place for players putting opponents next to them, if they fuck it up, they fuck it up
            - Max distance is 30 blocks before it gives up
- P1pkmn1, P1pkmn2, P1pkmn3, P2pkmn1, etc. (T1P1pkmn and T2P2pkmn for tag teams) are pokemon locators
    - Like corners, these have 3 phases
        - Red

        - Yellow
        - Green
    - Red phase is too far away from the stadium block
    - Yellow means the other pokemon need to be placed
    - Green means all pokemon have been placed correctly
    - Nothing prevents the player from doing wacky configuration where pokemon are placed down, it's a sand box game, can't police everything
        - If you place a pokemon locator in the air, if a pokemon can fly it will place them in the air and do the flying animation, if they can't it will go on the ground
- Confirm
    - Button to confirm all your selections and close the screen to be able to start battling. When confirmed, the beacons that were placed will disappear (maybe some animation? Maybe a Drone Rotom grabs them?). When in "edit" mode, the beacons will now appear as projections
    - The Confirm button then turns to "edit" when pressed. If the player clicks "edit" they once again can grab the beacons from the stadium block and replace them. When in edit mode, projections of where the beacons were placed before are projected in their respective spots.

Starting a Battle

- When you walk in a stadium block arena configuration, aura/projections where players should stand appear
- When standing in an aura it turns yellow
- When both players are standing in the auras it turns green
    - Count down from 3 starts, art team discretion how this looks
- If team preview is selected a screen like this pops up with animation

- 

  - You then select the pokemon you want to send out
  - What you select first is what goes out first
  - If the configuration is set up to have less than 6 pokemon and you have a party of 6 you only select the first set of pokemon and thats all that is used
    - For example, 4 pokemon with a party of 6 will only allow you to select 4 pokemon and use 4 pokemon
- If team preview is not selected a screen like this appears
  - 

  - If the configuration is set up to have less than 6 pokemon and you have a party of 6 you only select the first set of pokemon and thats all that is used
    - For example, 4 pokemon with a party of 6 will only allow you to select 4 pokemon and use 4 pokemon
  - You CAN NOT see your opponents pokemon in this screen
